

Instructions, care & safety notices

E-Stim probes

Congratulations!

So you have managed to bag a Mystim probe. A good decision. This way, you have chosen a quality product „made in Germany“.

Our probes are based on medical technology. The material mix of surgical steel and synthetics make the probes especially light, so that they stay in place even if you move or walk around. Due to their light weight and ergonomic shape, they are great for electrostimulation beginners as well as experienced users.

To make sure you will have lots of fun with your toy for a good long time to come, please read carefully the following instructions for use.

We wish you an excellent time! Your Mystim team

This is how you use the probes

The most important thing at the start: To find the best intensity for you, do not turn on the stimulation current until you've put the probe in place. Please use only water-based lubricant, for example our „Bonnie & Glide“, or – for even better conductivity – our Mystim conductive gel „The Goldfather“.

With the exception of the vaginal probe Julian, all you can use all Mystim probes both vaginally and anally.

With Julian, please make sure that you insert him the right way around so he doesn't make you uncomfortable: His metal conductive surfaces on the sides should point to the left and right of your body, not the front and back.

The thing with the stimulation current

E-Stim, i.e. electrical stimulation, has been gaining ever more popularity in recent years, and no wonder. In your intimate areas there are lots of nerves – far more than in other parts. With a properly regulated device for electrical stimulation and the appropriate toys, you can stimulate every single one of these nerves to a state of ecstasy.

This stimulation is perfectly safe if it is carried out with due care and attention and high-quality products.

There are a couple of things that you must be careful of:

- Persons with electronic or metal implants (e.g. heart pacemakers) must not use stimulation current without previously consulting a medical doctor. The same applies to persons with heart trouble or cardiac arrhythmia.
- Stimulation must never be carried out in a way in which current is conducted through the brain or the heart. Never stimulate the larynxes or the area of the throat. Muscle cramps in this area can lead to suffocation.
- Electrical stimulators must not be used in the vicinity of explosive or inflammable materials.
- Stimulating current may only be used on healthy skin.
- Keep out of reach of children.

Cleaning and maintenance

Each of our toys is made of material used in medical engineering and is therefore particularly hygienic and easy to clean with water and a mild soap.

At regular intervals, you should also use a skin-friendly disinfectant (Please observe the respective instructions for use).

Before re-using your probe, please make sure that it is completely dry.

EU-Declaration of conformity

We, Mystim GmbH, declare that this product is in compliance with all relevant directives. The full text of the EU declaration of conformity is available at the following internet address: <https://www.mystim.de/en/b2b/konformitaetserklaerungen>.
